

Godel.

After Pais on Bohr, Hofmann on Einstein, Feynman, and Weinberg we come finally to Godel. Here I think may lie the answer. For really his intuitions coincide with my own predilections. I am struck by his idea of numbers being a non-physical reality ie outside space and time. Thus like God they are true but unprovable. Mind cannot be mechanical pace Turing as it is always developing into something newer, greater. I agree with him that we will discover psychic particles in the way we have quantum particles and that will produce the conclusion of the free mind. Further it will lead to the confirmation that objective time is an illusion for it depends only on our perception of matter and its motion. Thus we will be ready for the unity of the divine with the molecular theory of our existence. Meanwhile only the poem can bridge that divide for the meantime.
